Houston PolyTank designs, produces, and installs plastic storage tanks. Our tanks are produced by extruding polypropylene or polyethylene around a drum. This method emulates technology in the industry that has been proven to produce the highest quality of tanks for over 15 years. Standard poly tanks in the market today are rotationally molded and have many limitations such as wall thickness and height. This unique approach gives us the ability to design and build tanks that meet the customer's specific needs without these limitations. Our design process takes into consideration the working temperature, corrosion issues, specific gravity, and the aggressive properties of the product being stored to insure the proper tank is built for our customers. We offer tanks made with Polypropylene, Polyethylene, or Co-Poly. Tank sizes can vary from a few hundred gallons up to 50,000 gallons. Tanks can be made with flat bottoms and cone bottoms for total drain capability as well as specialty applications. Several options and accessories can be added to our tanks such as built-in secondary containment, heating components, insulation systems (using polyurethane foam), OSHA compliant ladders, mixer mounts, and catwalks.

Left: Tanks shown with optional OSHA compliant ladders, safety cages, and hand rails with kick plates

Below: Open Top Tank

Left: The lower portion of tank shell showing a wall thickness of 3-1/2". Thicknesses can vary depending on the diameter, height, material used, and specific gravity of the application.

Houston PolyTank can produce cone bottom, flat bottom, and specialty tanks. Tanks can be built from polypropylene, polyethylene, and co-poly to fit your application. Tanks range in sizes from a few hundred gallons up to 50,000 gallons.

Tanks can be custom built to fit all of your needs, from replacement tanks to new bulk tanks
